

Crop Report

11-Aug-2017

UpperNorthFS: Crouch

Crop: Wheat
Cultivar: Sceptre
Sowing details: 120 plants/m² on 25-Apr
Expected maturity date: 12-Oct

Paddock Details
Initial conditions date: 23-May
Loamy Sand over Sandy Clay Loam
and Fine Sandy Clay (Port Germein
No601-YP)
900 mm max rooting depth
Stubble: 700 kg/ha of Oats
No till

Grain Yield Outcome

This graph shows the probability of exceeding a range of yield outcomes this season. It takes into account your pre-season soil moisture, the weather conditions so far, soil N and agronomic inputs. The long term record from your nominated weather station is then used to simulate what would have happened from this date on in each year of the climate record. The yield results are used to produce this graph.

Hay Yield Outcome

This graph shows the probability of exceeding a range of hay yield outcomes this season. It takes into account the same factors as the grain yield graph above. When above ground dry matter is below 2t/ha, hay yield is assumed to be 70% of dry matter, with a moisture content of 13%. When dry matter is between 2 and 12t/ha, hay yield is assumed to be between 70 and 75% of dry matter (sliding scale). When dry matter is above 12t/ha, hay yield is assumed to be between 75 and 80% (sliding scale).

Current dry matter: 5178.2kg/ha

Availability of Soil Nitrogen to Growing Roots

Water Stress

Nitrogen Stress

Brief periods of mild to moderate stress do not necessarily lead to reduced yield. To see the likely impacts of additional nitrogen fertiliser rates use the Nitrogen and Nitrogen Profit reports.

Median projected crop performance and requirements for the next 10 days assuming no rain and no added fertiliser

The water available to roots above the stress threshold is the amount of PAW (mm) above one third of the total water holding capacity of this soil. If the water values are below this stress threshold the water available to roots above the stress threshold will be negative.
