This project has seen the development of breeding populations for awnless wheat varieties suitable for grain (APW or AH quality) or hay (e.g if frosted) giving growers more profitable options to mitigate damage on-farm.

Researcher Shafiya Hussein will lead a walk through the trial at the three times of sowing, discussing varietal development, new crosses, and favorable traits.

Shafiya is the Pure Seed Manager and Wheat QP at LongReach Plant Breeders. Shafiya has 18years of experience in laboratory and field research including herbicide and toxicity tolerance work and National Variety Trials.
